

"Architecture is the physical form that envelops the lives of men in the complexity of their relationships with their environment." Jean Renaudie

The composed problem tries to design a set of housing environment With the environmental notion In the new city of Bouinan.By taking into account the environment in all the design phases of the project beginning with the development plan until the architecture of the project

This conception(design) pursues the following objectives:

- Create an integration with the environment
 - Direct the internal spaces according to the environmental marks
 - Strengthen the transparency in the façade
-
- ❖ creating an integration with the environment through the adoption of organic forms of outdoor spaces, dynamics and hierarchy of course. Using flowing shapes reminiscent of the environment
 - ❖ is to make a good orientation to areas of environmental benchmarks for visual comfort, aerodynamics. The aspect ratio is presented by the modular spaces, the functionality of the spaces from their organisation.et also a hierarchy of spaces
 - ❖ is to use a double glazing to consolidate transparency and moucharabiehs at front for treatment. A functional relationship assured in different levels of the project, with smooth flowing forms

To design with the environment aims at satisfying three complementary requirements

- ❖ **Control:** the impact of a building on the environment
- ❖ **Create:** a healthy and comfortable environment for its users
- ❖ **Preserving:** natural resources by optimizing their use.

"We must think globally, but act locally"
